

Performance Stability Comparison

[SYSTEM-WISE ANALYSIS: Coefficient of Variation Inverse, n=1000 steps]

Methodology: FedSemGNN stability metric computed as $1/(1 + CV_reward + CV_latency)$ where CV is coefficient of variation (σ/μ).
Analysis Type: SYSTEM-WISE variability assessment. Formula: $Stability = 1/(1 + \sigma_reward/\mu_reward + \sigma_latency/\mu_latency)$. Range: [0,1]. Higher = more stable.
