

Performance Stability Comparison

[SYSTEM-WISE ANALYSIS: Coefficient of Variation Inverse, n=1000 steps]

Methodology: FedSemGNN stability metric computed as $1/(1 + CV_reward + CV_latency)$ where CV is coefficient of variation (σ/μ).
Analysis Type: SYSTEM-WISE variability assessment. Formula: $Stability = 1/(1 + \sigma_{reward}/\mu_{reward} + \sigma_{latency}/\mu_{latency})$. Range: $[0, 1]$. Higher = more stable.
